Equipped with one of the following options:

- SA0663 - Radio Professional
- SA0606 - Navigation Business
- SA06FP - Radio Visual Boost
- SA06UM - Mini navigation system
- SA06UN - Navigation
- SA06UP - Navigation Plus

SITUATION

After driving through an area with poor radio reception (tunnel, parking garage, etc.), there can be a delay of up to 4 minutes (approximate) for the list of available FM stations to update.

CAUSE

Sender lists (stations available for reception) are updated on a fixed time interval. If the last update event was while in an area of poor reception, the update will not occur until the next scheduled event.

INFORMATION

As of 11/2015, all Entry-NAV/Media head units supplied in new vehicles were upgraded for improved noise characteristics and quality.

As a part of this upgrade, the hardware updating the sender lists was changed from an “update after every diversity reception interruption or maximum of four minutes” configuration to “regular interval updates (every four minutes) without regard to diversity reception status” configuration. This may cause a delay of up to four minutes for updates to the sender list when leaving areas of poor reception.

The last received transmitter, before the entrance into underground car parking or a tunnel, is still received and will show station identification.

This fixed interval update does not apply to Traffic Message Channel updates which remain active.

This new equipment operation pattern may be noticed by the customer after replacement of their Head unit. All replacement Head units delivered since 01/2016 have the upgraded design.

An immediate solution would be for the customer to select one of their stored favorite stations via the menu or favorites buttons.

PARTS INFORMATION

Parts exchange or a software update are not effective or approved for this situation.
